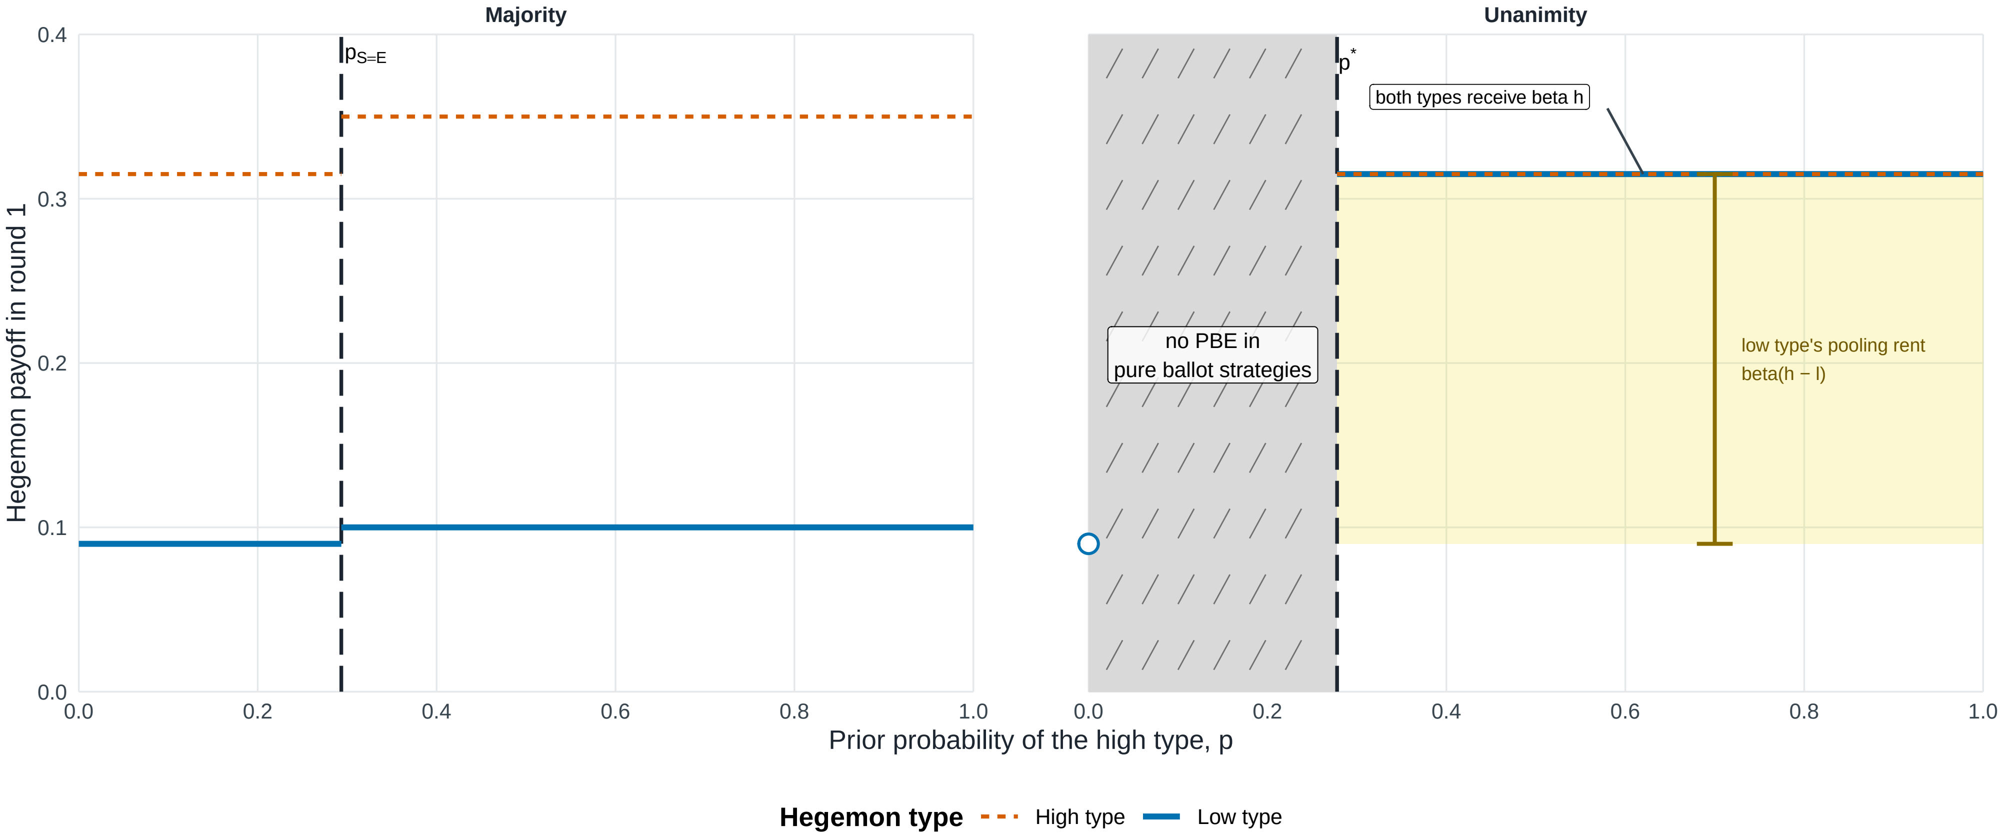
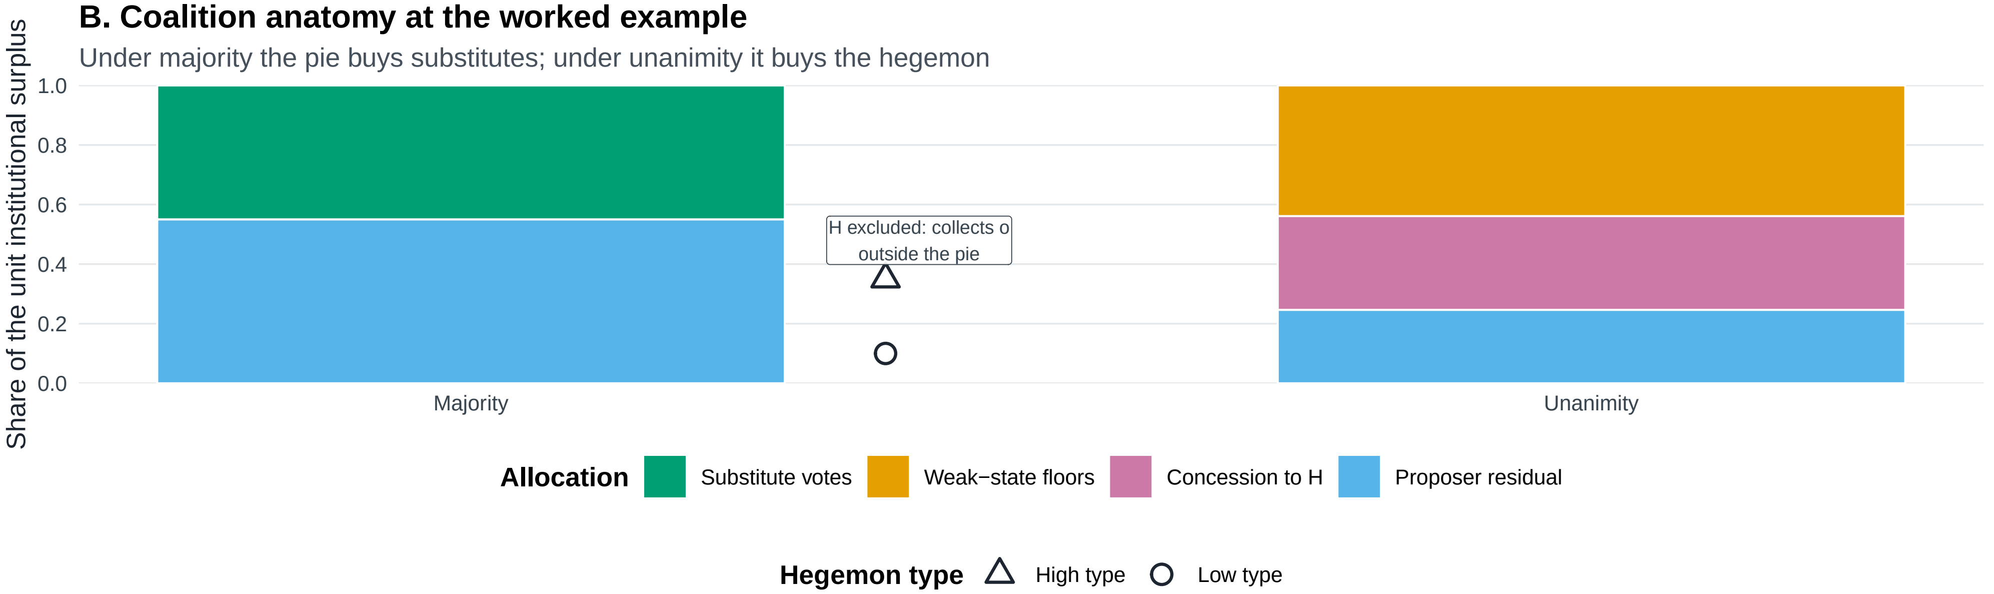
Prices and coalition anatomy

A. Prices paid to the hegemon



B. Coalition anatomy at the worked example

Under majority the pie buys substitutes; under unanimity it buys the hegemon



Majority caps the hegemon's price by buying substitute votes; unanimity pays the hegemon directly. Panel A plots type−specific round−1 payoffs. Majority pays beta l and beta h through p_S=E, then exclusion leaves H with its disagreement payoff; unanimity has no PBE in pure ballot strategies for 0 < p <= p* and pools at beta h above p*. Under unanimity both types receive beta h; the dashed high−type line is drawn over the solid low−type line where they coincide. The yellow span is the low type's pooling rent beta(h − l), not the informational−rent measure relative to public information. Panel B decomposes the unit surplus at p = 0.35: majority buys k substitutes at beta/m, while the adjacent markers show the excluded H collecting o outside the pie; unanimity pays m−1 weak−state floors, beta h, and the proposer residual. Parameters: l = 0.100, h = 0.350, m = 4, beta = 0.90. Note: Model−generated regions; all boundaries closed−form.
