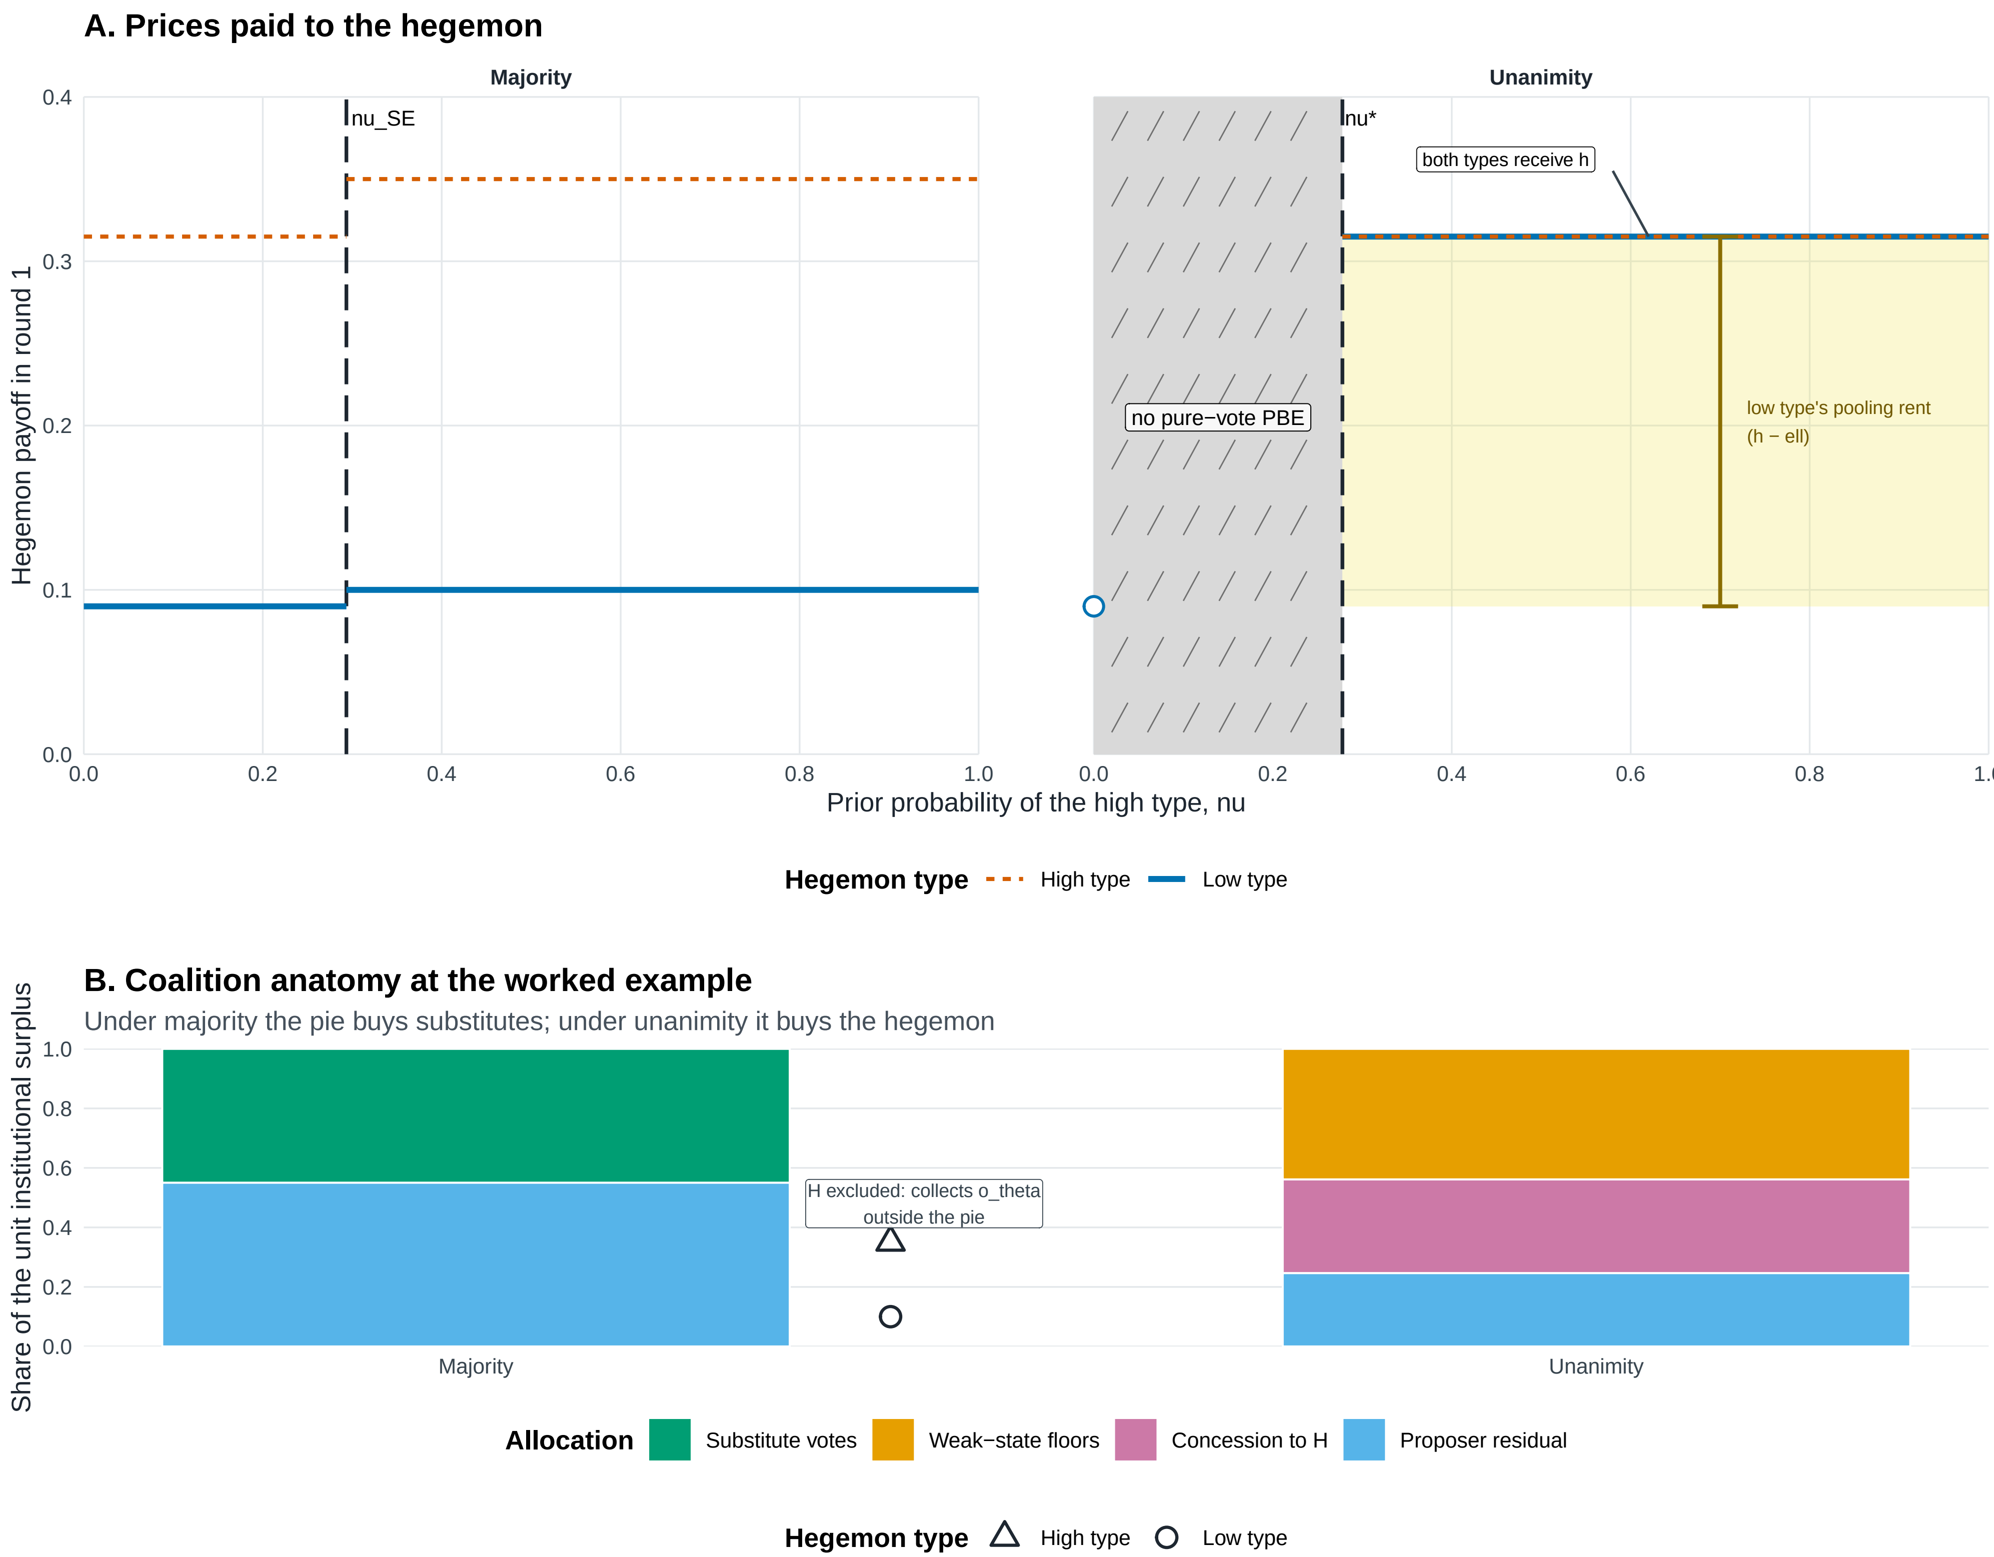
Prices and coalition anatomy



Majority caps the hegemon's price by buying substitute votes; unanimity pays the hegemon directly. Panel A plots type−specific round−1 payoffs. Majority pays beta x o0 and beta x o1 through nu_SE, then exclusion leaves H with its outside option; unanimity has no pure−vote PBE for 0 < nu <= nu* and pools at h = beta x o1 above nu*. Under unanimity both types receive h; the dashed high−type line is drawn over the solid low−type line where they coincide. The yellow span is the low type's pooling rent h − ell, not the public−benchmark rent estimand. Panel B decomposes the unit surplus at nu = 0.35: majority buys q−1 substitutes at beta/m, while the adjacent markers show the excluded H collecting o_theta outside the pie; unanimity pays m−1 weak−state floors, h, and the proposer residual. Parameters: o0 = 0.100, o1 = 0.350, m = 4, beta = 0.90. Note: Model−generated regions; all boundaries closed−form.
