

Power versus information

A. Public and private-information payoffs

B. Informational rents and their institutional contrast

Exact power-information decomposition at the working illustration ($\alpha_0 = 0.10$, $\alpha_1 = 0.35$, $m = 4$, $\beta = 0.90$, $\nu = 0.80$). Panel A compares each rule under public and private information. Panel B reports RI_M , RI_U , and $\Delta RI = RI_U - RI_M$ component by component. At this point majority excludes and unanimity pools: the low-type values are 0.010, 0.225, and 0.215, while all high-type informational-rent values are zero. This is a working numerical illustration of the exact N7 formulas, not a calibration.
