

Prices and coalition anatomy

A. Prices paid to the hegemon

B. Coalition anatomy at the worked example

Under majority the pie buys substitutes; under unanimity it buys the hegemon

Majority caps the hegemon's price by buying substitute votes; unanimity pays the hegemon directly. Panel A plots type-specific round-1 payoffs. Majority pays βl and βh through $p_{S=E}$, then exclusion leaves H with its disagreement payoff; unanimity has no pure-vote PBE for $0 < p \leq p^*$ and pools at βh above p^* . Under unanimity both types receive βh ; the dashed high-type line is drawn over the solid low-type line where they coincide. The yellow span is the low type's pooling rent $\beta(h - l)$, not the public-benchmark rent estimand. Panel B decomposes the unit surplus at $p = 0.35$: majority buys k substitutes at β/m , while the adjacent markers show the excluded H collecting ϕ outside the pie; unanimity pays $m-1$ weak-state floors, βh , and the proposer residual. Parameters: $l = 0.100$, $h = 0.350$, $m = 4$, $\beta = 0.90$. Note: Model-generated regions; all boundaries closed-form.
