

Appendix Figure C.1. Institutional comparison in the outside-option plane

Prior $\nu = 0.35$; $m = 4$ weak states; $\beta = 0.90$

Analytical boundary

— $\nu = \nu^*$ - - - $\nu = \nu_{SP}$ · · · $o_0 = \beta o_1$
- - - $\nu = \nu_{SE}$ — · $o_0 = 1/m$ — · $o_1 = 1/m$

Private-rule comparison

H indifferent

H prefers majority

H prefers unanimity

No comparison: no pure-vote PBE (unanimity)

The triangular domain satisfies $0 < o_0 < o_1 < 1$. Colored polygons report the type-specific payoff comparison between unanimity and majority; the neutral hatched polygon has no comparison because unanimity has no pure-vote PBE. The worked example is $o_0 = 0.100$ and $o_1 = 0.350$. All boundaries are evaluated analytically rather than filled by a classification grid. Note: Model-generated regions; all boundaries closed-form.
