

**Figure F1 (worked-example slice). Institutional preference depends on type and substitutability**

Outside-option slice  $o_0 = 0.286 \times o_1$ ;  $m = 4$  weak states;  $\beta = 0.90$

Colored polygons report the type-specific payoff comparison between unanimity and majority. The neutral hatched region has no comparison because unanimity has no pure-vote PBE. The left-edge segments report the distinct complete-information endpoint at  $\nu = 0$ . Boundaries are  $\nu^* = (1-\kappa)o_1/(1-\kappa o_1)$ ,  $\nu_{SP} = \beta(1-\kappa)o_1/[1-\beta\kappa o_1-\beta(q-1)/m]$ , and  $\nu_{SE} = \beta(1/m-\kappa o_1)/[\beta(1/m-\kappa o_1)+1-\beta q/m]$ . The dashed horizontal line is the substitute cost  $o_1 = 1/m$ . Note: Model-generated regions; all boundaries closed-form.
