

Figure F1. Institutional preference depends on type and substitutability

Outside-option slice $o_0 = 0.750 \times o_1$; $m = 4$ weak states; $\beta = 0.90$

Colored polygons report the type-specific payoff comparison between unanimity and majority. The neutral hatched region has no comparison because unanimity has no pure-vote PBE. The left-edge segments report the distinct complete-information endpoint at $\nu = 0$. Boundaries are $\nu^* = (1-\kappa)o_1/(1-\kappa o_1)$, $\nu_{SP} = \beta(1-\kappa)o_1/[1-\beta \kappa o_1 - \beta(q-1)/m]$, and $\nu_{SE} = \beta(1/m-\kappa o_1)/[\beta(1/m-\kappa o_1) + 1 - \beta q/m]$. The dashed horizontal line is the hegemony threshold $m \times o_1 = 1$. Note: Model-generated regions; all boundaries closed-form.
