

Figure F1. Institutional preference depends on type and substitutability

Outside-option slice $o_0 = 0.750 \times o_1$; $m = 4$ weak states; $\beta = 0.90$

Colored polygons report the type-specific payoff comparison between unanimity and majority. The neutral hatched region has no comparison because unanimity has no pure-vote PBE. The left-edge segments report the distinct complete-information endpoint at $\nu = 0$. Boundaries are $\nu^* = (1-\kappa)o_1/(1-\kappa)o_1$, $\nu_{SP} = \beta(1-\kappa)o_1/[1-\beta\kappa o_1-\beta(q-1)/m]$, and $\nu_{SE} = \beta(1/m-\kappa)o_1/[\beta(1/m-\kappa)o_1+1-\beta q/m]$. The dashed horizontal line is the substitute cost $o_1 = 1/m$. Note: Model-generated regions; all boundaries closed-form.
